摘要

The LED industry is one of the more competitive optoelectronics industry in Taiwan. Die manufacturing is an important part in the LED supply chain. The make to order production strategy is a general production model for the LED die manufacturer to satisfy the variety requirement of their customers. Because the specificity of production output for the LED die manufacturing process, effective inventory control and exact due-date fulfillment are the key issues for the competitiveness. Therefore, this paper presents the LED die manufacturing process, the specificity of its production output and production management issues in the industry practice. This study will facilitate a LED plant to improve their competitiveness or further study.
