摘要

In recent years, Internationalization and liberalization the trend of worldwide, the global economic structure of showed substantially transformation, global economic system and the industry at all levels of impact, dramatic change and transformation of prompted the global industry at all levels. The rapid economic development in Taiwan, all regions of industrial activity between to warm, but the distribution and intensity of unevenly, resulting in emigration government in the past to concentrate resources in three major metropolitan areas, making the unevenly urban and rural development resulting in in the phenomenon of heavy North Light South, but the government in recent years, the economic center of gravity southward migration, the original three major metropolitan areas to expand into five major metropolitan areas. Tainan city belonged to the youngest metropolitan areas in five major metropolitan areas, Rich natural resources and considerable economic base, become the most development potential in the island over the metropolitan area in the metropolitan area. ntegration of the Tainan metropolitan area is displayed future development worthy of further study.

In the present study, regional economics theory and economics-base analysis method are explained first, then use a method of Location Quotient(L. Q. ) to analyze of the basic industries in Tainan metropolitan area. And then, the population and employment multiplier of Tainan metropolitan area are analyzed by econometric methods which is based of the study of the development in this region.

The main results of this paper are(1) Tainan metropolitan area is Manufacturing based on industry.(2)Basic industry is really of the crucial power for the local todevelopment and it yields to a noticeable effect upon the employment and population.
