## 摘要

Nowadays is competition intensely, the job market becomes more demanding on the professional skills of IT professionals. Therefore, not only the information jobholders have the most basic school record, but also enhance their professional capabilities by get certificates. In this paper, we used frequency distribution and Chi-Square test to describe the information of School IT certification courses. To probe the types and status of IT certificates currently promoted by the MIS departments of universities/colleges in Taiwan. And, probe the differences between the actual certificate courses in schools and the ones perceived by the IT professionals, and to provide universities/colleges with that. Schools and enterprises complement each other only then may display the best benefit. According to the conclusion, we discovered the type of certificate in different educational systems' universities/colleges has the remarkable difference. In addition, there are significant differences between certificates promoted by the universities/colleges and the ones desired by the IT professionals. Therefore, certificates promoted by schools not conform to IT professionals' anticipation.
