## 摘要

Disseminating the truths and life education of the Bible to the world has been the goal of Christian practice. Through the scriptures of Old Testament and New Testament written on papyrus, vellum and print media as well as disseminating via radio and TV in modern times, it has proved that Christian churches have kept applying different media to propagate gospel in history. Therefore, how coworkers of churches in Christ, the voice of gospel of Christ, apply modern information technology to make ancient Gospel touch the heart of all mankind is quite important.

The purpose of this research was to determine the criteria that reflect the required information literacy in disseminating Christianity to the world. Research was conducted using a two-step procedure that first utilized Fuzzy Delphi Method to establish the proper criteria by which the importance of information literacy can be measured. We then applied the Fuzzy Analytic Hierarchy Process to determine the importance of each criterion to the coworkers of the church in disseminating Christianity. Based on the four information literacy constructs, this study found that “Computer literacy” and “Network literacy” are the ones of the most critical constructs, while the criteria “Being able to use word processing and presentation software,” “Being able to use blog,” and “The ability to determine whether the media discourse is the facts, personal perspective or public opinions” are the most important criteria.
