### 摘要

We implement the storyline in our motion robot, which we call storytelling in this paper, to increase the effect of studying from storytelling by using the robot. We take advantage of story cards, which is applying story card to storytelling, with more flexible in making an arrangement of plot. With different sequences that are chosen by children, the grammatical structure which is implicit in story is changed. The intention of characters in cards will change by variety of grammatical structure, and bring different story further.
