Abstract

An evaluation and analysis of coast tourism in northern Taiwan was studied by using an established beach rating checklist for ecotourism management of the North Coast & Guanyinshan National Scenic Area Administration. The results of rating checklist and biodiversity showed that Yeliu Geological Park, Kuai-Ho Coast, Linshanbi Recreation Area and Shimen Cave have potential on ecotourism, also have more value to visit. JinShan mystical coast also has the potential for ecotourism, but it is necessary for total quality control of tourist and more safe faculties. The sand beach in east side of Qianshui Bay is good for general water recreation by its well services, but the untidy scenes of coast and waste water should be improved. The other three places were suggested to maintain the present situation, and keep their environment with a whole integrity.
